

FraudLens AI

***FraudLens AI** is a multi-modal cyber fraud investigation platform designed to help users identify, analyze, and prevent online scams in real time. As digital payments, online banking, and internet-based communication continue to grow, cybercriminals increasingly exploit users through phishing attacks, OTP fraud, fake job offers, lottery scams, KYC verification scams, and fraudulent payment requests. FraudLens AI addresses this challenge by providing an intelligent, accessible, and explainable fraud detection solution.*

*The platform enables users to either paste suspicious text messages or upload screenshots of potentially fraudulent content. Using **Optical Character Recognition (OCR)**, FraudLens AI extracts text from images and analyzes it through a combination of keyword-based threat detection, scam pattern recognition, URL analysis, and risk-scoring techniques. The system identifies common indicators of cyber fraud such as urgent payment requests, credential theft attempts, banking verification messages, suspicious links, and requests for sensitive personal information.*

*Based on its analysis, FraudLens AI generates a **risk score**, classifies the threat type, provides an **evidence summary**, and delivers an **AI-powered investigation report** explaining why the content was flagged. The platform also offers actionable security recommendations, helping users avoid dangerous links, protect personal data, and verify communications through trusted channels.*

*Built using **Python, Streamlit, and EasyOCR**, FraudLens AI combines cybersecurity awareness with explainable AI in a lightweight and user-friendly application. By transforming complex fraud indicators into clear, understandable insights, the platform empowers individuals to make safer online decisions and reduce their exposure to digital threats. Ultimately, FraudLens AI contributes to a more secure digital ecosystem by promoting cyber awareness, fraud prevention, and responsible online behavior.*
